

## SPECIFICATION

## THERAPEUTIC AGENT FOR PSORIASIS

5 TECHNICAL FIELD

This invention relates to a therapeutic agent for psoriasis, comprising a vitamin D derivative as an active ingredient.

10 BACKGROUND ART

Psoriasis is a chronic intractable skin disease, characterized by abnormal proliferation of skin cells. Its etiology is not yet clear, but the deviation of skin cells from the normal growth mechanism and differentiation mechanism is considered to be a main cause. There has been an increase in the number of cases of psoriasis in recent years, and most psoriatic cases involve well-demarcated papules or erythemas with thick scales, and follow a chronic course. This type of psoriasis is called psoriasis vulgaris. Unlike psoriasis vulgaris, psoriasis pustulosa forms pustules on erythemas. Psoriasis pustulosa is classified into generalized (Zumbush's) pustular psoriasis which occurs over wide areas and involves systemic symptoms, and localized (Barber's) pustular psoriasis which develops over small areas, such as the hands or feet. Psoriasis may occasionally cause redness, swelling, degeneration or ankylosis of joints of the hands or feet, elbow and knee. This is called arthritic psoriasis.

Treatments for psoriasis include external application of corticosteroids, photochemotherapy (PUVA), and oral administration of retinoids. However, these treatments have not always had a satisfactory therapeutic effect. In recent years,  $1\alpha,25$ -dihydroxyvitamin  $D_3$ , calcipotriol, etc., which are known as active vitamin  $D_3$ , have been shown to have the activity of suppressing the proliferation of keratinocytes, and to be useful as therapeutic agents for psoriasis (European Patent Publication No. 129003, "Vitamin D in Dermatology", edited by Knud Kragballe (2000), Marcel Dekker Inc., and Drugs 43(3), 415-429 (1992)). However, more potent and more effective pharmaceuticals are still desired.

$2\beta$ -(3-Hydroxypropyloxy)- $1\alpha,25$ -dihydroxyvitamin  $D_3$ , which is a vitamin D derivative having a substituent at the 2-position, is known to have a calcium regulating action (JP 61-267549 A) and an osseous union promoting action (JP 08-12580 A). However, its use as a therapeutic agent for psoriasis has not been known at all.

20

#### DISCLOSURE OF THE INVENTION

As described above, existing treatment methods and therapeutic agents for psoriasis have not been entirely satisfactory, and more potent and effective treatments and therapeutic drugs have been desired. It is an object of the present invention to provide an effective therapeutic agent and treating method for psoriasis.

The inventor of the present invention investigated the suppressing action of  $2\beta$ -(3-hydroxypropyloxy)- $1\alpha,25$ -dihydroxyvitamin  $D_3$  on the keratinocyte proliferation. The inventor has found that surprisingly this compound has a very potent suppressing action, in comparison with active vitamin  $D_3$ , and has accomplished the present invention.

That is, the present invention provides a therapeutic agent for psoriasis, which agent comprises a compound represented by the following Formula (I)

10

as an active ingredient.

The therapeutic agent for psoriasis according to the  
15 present invention preferably suppresses the proliferation  
of keratinocytes.

The therapeutic agent for psoriasis according to the present invention may be administered to animals as well as humans.

20           According to another aspect of the present invention,  
there is provided a method for the treatment of psoriasis

in a human or an animal, the method comprises administering a therapeutically effective amount of a compound represented by the following Formula (I)

5

to a human or an animal in need of such treatment.

According to still another aspect of the present invention, there is provided use of a compound represented  
10 by the following Formula (I)

in production of a therapeutic agent for psoriasis.

#### BRIEF DESCRIPTION OF THE DRAWING

FIG. 1 is a graph showing the effect of suppressing the proliferation of cultured human keratinocytes by an active vitamin D<sub>3</sub> (designated as "1,25D3" in the figure) and 2β-(3-hydroxypropyloxy)-1α,25-dihydroxyvitamin D<sub>3</sub> (designated as "ED-71" in the figure). In the figure, filled rhombuses (◆) represent the active vitamin D<sub>3</sub>, and open circles (○) represent ED-71.

#### PREFERRED MODE FOR CARRYING OUT THE INVENTION

The entire disclosure of Japanese Patent Application No. 2002-224297, an application as the basis for priority claimed by the present application, is incorporated herein by reference in its entirety.

The compound represented by the Formula (I), namely, 2β-(3-hydroxypropyloxy)-1α,25-dihydroxyvitamin D<sub>3</sub>, can be synthesized, for example, by the method described in JP 61-267549 A, although the method for its synthesis is not limited.

The therapeutic agent for psoriasis according to the present invention can be administered orally, parenterally (subcutaneous injection, intravenous injection, intramuscular injection, intraperitoneal injection, etc.), enterally, or topically. Topical administration, such as by an agent for external use, is preferred, but systemic administration as an oral agent or an injection may be performed. It is also possible to use a mode of administration, such as oral administration, injection, or

external use, in a suitable combination.

The therapeutic agent for psoriasis according to the present invention may contain a pharmaceutically acceptable carrier or diluent in addition to the active ingredient.

5 Examples of the carrier or diluent are vehicles (starch, lactose, etc.), disintegrants (alginic acid, etc.), tablet lubricants (stearic acid, talc, etc.), binders (starch, etc.), antioxidants (ascorbic acid, etc.), emulsifiers (polysorbate, etc.), surfactants (sorbitan monoesters,  
10 etc.), preservatives (benzoic acid), perfumes, and colorants. Other therapeutic ingredients may be contained further.

The therapeutic agent for psoriasis according to the present invention can be appropriately formulated according  
15 to the route of administration, such as oral administration, enteral administration, parenteral (including subcutaneous, intramuscular, and intravenous) administration, or external use.

For oral administration, such formulations as  
20 tablets, capsules, powders, granules, syrups, and elixirs are available. For parenteral administration, such formulations as injections (e.g., liquids or suspensions) are available. For external use as topical administration, such formulations as ointments, creams and lotions are  
25 available. For enteral administration, such formulations as suppositories and enemas are available.

The dose of the therapeutic agent for psoriasis in the present invention can be selected, as appropriate,

according to the state of disease, the body weight and age of a subject to be treated, the route of administration and the dosage form of the agent of the present invention. For administration to animals, the dose is greatly affected by the body weight of individual animals. In the human adult, the usual oral dose of  $2\beta$ -(3-hydroxypropyloxy)- $1\alpha,25$ -dihydroxyvitamin  $D_3$ , as the active ingredient, can be selected from the range of 0.0001  $\mu\text{g}$  to 1,000  $\mu\text{g}$ , preferably 0.001  $\mu\text{g}$  to 100  $\mu\text{g}$ , more preferably 0.01  $\mu\text{g}$  to 10  $\mu\text{g}$ , most preferably 0.1  $\mu\text{g}$  to 1  $\mu\text{g}$ , per day, and this dose can be used once daily or as two to three divided doses per day. For external medicine, such as an ointment, the dose of this compound as the active ingredient can be selected from the range of 0.0001  $\mu\text{g}$  to 10,000  $\mu\text{g}$ , preferably 0.001  $\mu\text{g}$  to 1,000  $\mu\text{g}$ , more preferably 0.01  $\mu\text{g}$  to 100  $\mu\text{g}$ , most preferably 0.1  $\mu\text{g}$  to 25  $\mu\text{g}$ , per day.

#### Examples

The present invention will be described in further detail by the following Examples and Manufacturing Examples. (Example 1)

The effect of suppressing the proliferation of cultured human keratinocytes by  $2\beta$ -(3-hydroxypropyloxy)- $1\alpha,25$ -dihydroxyvitamin  $D_3$  (hereinafter referred to as "ED-71") was investigated.

KGM-2 culture medium was added to each well of a 96-well plate (COSTAR 3595), and adult-human-derived keratinocytes (Clonetics) were seeded at a cell count of

1×10<sup>3</sup>/well. Then, active vitamin D<sub>3</sub> (1α,25-dihydroxyvitamin D<sub>3</sub>, produced by Solvay Pharmaceuticals) or ED-71 (produced by Chugai Seiyaku) was added to each well in a final concentration of 1×10<sup>-10</sup> mol/L, 1×10<sup>-9</sup> mol/L, 1×10<sup>-8</sup> mol/L, or 1×10<sup>-7</sup> mol/L. The cells were cultured in the KGM-2 culture medium at a cell concentration of 1×10<sup>3</sup>/200 μl/well for 3 days at 37°C in an atmosphere of 5% CO<sub>2</sub> and 95% air. [<sup>3</sup>H]thymidine was added in an amount of 7.4 kBq/well, and the cells were further cultured for 1 day. The culture medium was removed, and the cells were stripped off using 0.05% trypsin/EDTA (GIBCO BRL), and the amount of [<sup>3</sup>H]thymidine taken up by the cells was measured with a liquid scintillation counter (1450 MICROBETA, Wallac). The cells cultured and treated in the same manner as described above, except for the addition of the active vitamin D<sub>3</sub> or ED-71, were used as a control.

The results are shown in FIG. 1. In FIG. 1, the [<sup>3</sup>H]thymidine uptake into the cells treated with each drug is expressed as a percentage of the [<sup>3</sup>H]thymidine uptake into the control cells.

As shown in FIG. 1, the IC<sub>50</sub> (mol/L) value of the active vitamin D<sub>3</sub> was 3.05×10<sup>-8</sup> mol/L, while the IC<sub>50</sub> (mol/L) value of ED-71 was <1.0×10<sup>-10</sup> mol/L.

In accordance with the following calculation equation, the human keratinocyte proliferation suppressing activity of ED-71 was calculated as a relative value with respect to the active vitamin D<sub>3</sub>. This activity was found to be 305.23 or more.

Relative value = (IC<sub>50</sub> value of active vitamin  
D<sub>3</sub>)/(IC<sub>50</sub> value of ED-71)

This outcome shows that ED-71 has a very potent  
keratinocyte proliferation suppressing action, as compared  
5 with active vitamin D<sub>3</sub>.  
(Example 2)

The effect of ED-71 administered percutaneously and  
orally was investigated using hairless mice.

Percutaneous administration of a vitamin D<sub>3</sub>  
10 derivative in hairless mice was reported to cause  
hyperplasia of the epidermis (British Journal of  
Dermatology 1995; 132; 841-852). Following a single  
percutaneous dose of active vitamin D<sub>3</sub> (1 $\alpha$ ,25-  
dihydroxyvitamin D<sub>3</sub>) and ED-71 administered to hairless  
15 mice, ED-71 thickened the epidermis in a lower dose than  
the dose of active vitamin D<sub>3</sub>. When active vitamin D<sub>3</sub> and  
ED-71 were administered orally to hairless mice for 4 days,  
ED-71 thickened the epidermis in a lower dose than the dose  
of active vitamin D<sub>3</sub>. These results suggested that ED-71,  
20 administered percutaneously or orally, would be effective.  
(Preparation Example 1)

ED-71 (0.5 mg) is mixed with a hydrophilic ointment  
having the following formulation to obtain a hydrophilic  
ointment containing 0.5  $\mu$ g of ED-71 per gram:

25	White petrolatum	250 g
	Stearyl alcohol	220 g
	Propylene glycol	120 g
	Sodium lauryl sulfate	15 g

Ethyl parahydroxybenzoate	0.25 g
Propyl parahydroxybenzoate	0.15 g
<u>Purified water</u>	<u>appropriate amount</u>
Total amount	1000 g

5

(Preparation Example 2)

ED-71 (1.0 mg) is dissolved in 60 g of a triglyceride of a middle chain fatty acid, and 30 mg of sorbic acid is added as a stabilizer. The mixture is  
 10 processed in accordance with a conventional method using a gelatin shell soft capsule manufacturing machine to obtain soft capsules containing 1.0  $\mu$ g of ED-71 per capsule.

#### INDUSTRIAL APPLICABILITY

15 As described above,  $2\beta$ -(3-hydroxypropyloxy)- $1\alpha,25$ -dihydroxyvitamin D<sub>3</sub> has an excellent keratinocyte proliferation suppressing action. The therapeutic agent of the present invention, comprising this compound as an active ingredient, is expected to be useful for treatment  
 20 of psoriasis.
